

# Dashboard Widget Development

Mario Aquino  
[mario@ociweb.com](mailto:mario@ociweb.com)

I wanted to track my expenses & budget

(really, my wife wanted this)

**Ahh, I'll write software!**

We have Macs (2 laptops)

no iPhones :-)

I want to track

what my budget is  
how much we spend  
how much is left to spend  
I want it to cycle  
& I want it to be easy

Me: Aha! I'll write a Dashboard widget

What is a Dashboard widget?

Vista has a similar thing

Also Yahoo! desktop widgets...

But what I wrote won't work for them :-p

Made of:

HTML

CSS

JavaScript

Pretty images

\*Other stuff

Made with Dashcode (...meh)

I like that it has:

A debugger

Drag & drop UI components

i18n support

I can use TextMate from it

Dashcode editor is teh suck!

Files loaded in memory quirkiness

Widget lifecycle (events):

load (Called by HTML body element's onload)

widget callbacks:

show/hide

remove

\*sync

Interaction events you can create:

showFront / showBack

## What I like about JavaScript: You can totally mix-in stuff!

```
function CommandMonitor()  
{  
    this.timeOut = 300;  
    this.restartAfter = 60;  
}  
CommandMonitor.prototype.start = function() {...}  
function BudgetMonitor() {...}  
BudgetMonitor.prototype = new CommandMonitor();
```

It's dynamically typed!

\*Other stuff (from previous slide)

My widget tracks data  
Google spreadsheet FTW!

How to call from widget?!?!?

Dashboard widget JavaScript can call:

Objective-C plugins

Anything from the command line (Ruby!)

## Using Ruby from Widget:

`widget.system(call command line stuff here)`

Returns object used to register output readers

Calls are asynchronous

Used Ruby gem to call Google Spreadsheets

Apple keychain to store Google credentials

What I like about Ruby... Where do I start?

# My favorite part about this thingy:

```
def parse(lookup, pattern)
  $1 if lookup.find { |s| s =~ pattern }
end

def user_and_pass
  # Redirect stderr (where password is written to), to stdout
  lookup = `security 2>&1 find-generic-password -gs BudgetMinder`

  username_pattern = /^[\\s]+\"acct\"<blob>=\"(.*)\"$/
  password_pattern = /^password: \"(.*)\"$/

  username = parse lookup, username_pattern
  password = parse lookup, password_pattern
  [username, password]
end
```

A young boy in a yellow and white checkered shirt and white shorts is running away from a pigeon. The pigeon is in mid-flight, having just defecated on the boy's head. The boy has a pained expression and his hands are on his head. The background shows a paved area with other people in the distance.

**OH NOES!  
I GOT TEH  
SHITS ON ME!**
